

150kW Industrial Server Rack for Network Data Center

What is kilowatt per rack?

Kilowatt per rack (kW/rack) is the power assigned to a server rack in a data center. It is measured in kilowatts (kW) and represents the total power needed for all IT equipment in that rack. Colocation providers offer different power levels: Power density depends on server type, workload, and cooling efficiency.

Is 12 kW enough for a data center?

According to AFCOM's 2024 State of the Data Center Report, average rack density now sits around 12 kW. That's 2x the 6.1 kW per rack they initially reported in 2016. Despite doubling average density in just eight years, 12 kW still isn't enough. Data center operators are being asked to support 30 kW+ per rack.

What percentage of data centers have less than 10kW racks?

It's important to note that 37 percent of data centers still have racks of less than 10kW. There are three key reasons why these data centers have not seen substantial increases in rack density. Server virtualization has been around for decades, and containerization has been used for several years.
