

What are the components of a 5 G base station?

Firstly, in terms of energy equipment, the electrical component characteristics of the 5G base station's constituent units are modeled, including air conditioning loads, power supply systems, and energy storage systems.

What is the energy-saving operation model for 5 G base stations?

This section integrates the characteristics of power components and data flow to construct an energy-saving operation model for the 5 G base station. Through optimization, the optimal energy-saving and carbon-reduction strategies for each time period are obtained, thereby promoting energy conservation and emission reduction in 5 G base stations.

Are 5 G base stations energy efficient?

However, the construction and operation of 5G base stations face significant energy consumption challenges. Under full-load conditions, the power consumption of 5G base stations is approximately 3-4 times that of 4G base stations, which has a notable impact on energy consumption and environmental concerns (Zhang et al., 2020, Feng et al., 2012).

What are the characteristic constraints of 5 G base station units?

1) For energy equipment, the power component characteristic constraints of the 5 G base station units, including the air conditioning load characteristic constraints ((1),(2),(3)), power system characteristic constraints (Eq. (4)), and energy storage system characteristic constraints ((5),(6),(7),(8)).
