

For a given voltage source, it is always possible to define an output impedance, even if the latter is frequency dependent.

The stiff voltage source, unaffected by the inverter's operation, is treated as the grid voltage, while the impedance represents the output line impedance perceived by the inverter.

With PWM inverters, the output impedance stays very low up to high frequencies and the output voltage distortion due to circulating currents, even highly distorted currents, can be neglected.

To analyze the stability of the inverter-grid system using impedance-based stability criterion, inverter impedance has to be known. This paper proposes an inverter impedance estimation method, which ...

The input impedance of an inverter terminated in an impedance  $Z_L$  is  $1 / Z_L$ . Impedance and admittance inverters are the same network, with the distinction being whether siemens or ohms ...
