How does an off-grid solar system work?

In an off-grid solar system with utility power complementation, there are two primary energy sources: photovoltaic (PV) power generation and utility power. The load is the energy consumption point, while the battery both absorbs and releases electricity for the load.

How does solar power work?

Logic: Solar generation powers household loads first. Once loads are satisfied, excess energy charges the battery. Only after that is surplus power exported to the grid. Ideal for: Households prioritizing solar self-consumption (reducing grid usage) and energy independence to minimize energy costs. Flow: PV -> Load -> Battery -> Grid b.

What is inverter mode for solar self-consumption?

The inverter mode for solar self-consumption allows homeowners to store excess solar power during the day and use it in the evening, reducing dependence on the grid and lowering utility bills.

How do I choose a working mode for an off-grid inverter?

If there is no commercial power complementation, the inverter has only one working mode, which is the photovoltaic independent charging mode. Choosing the appropriate working mode for an off-grid inverter depends on various factors such as electricity availability, cost of mains power, and specific power requirements.
