Do energy storage configuration models work for new energy power plants?

This paper constructs an energy storage configuration model for new energy power plants using game theory and proposes a comprehensive benefit evaluation method. The main conclusions are: Energy storage configuration models were developed for different modes, including self-built, leased, and shared options.

Is there a unified statistical index system for new energy storage?

Up to now, a unified statistical index system and evaluation method standard for new energy storage has not yet been formed domestically or even internationally.

What is energy-to-power ratio (EPR)?

This key performance parameter can be described using the energy-to-power ratio (EPR), which presents the discharge time of energy storage systems at their full rated power output.

Can a new energy power plant share energy storage systems?

However, in the shared mode, multiple new energy power plants can interact and share energy storage, reducing their overall dependence on storage systems. In the leased and self-built modes, new energy power plants must independently lease or build energy storage systems.

Here, we quantitatively evaluate the system-wide impacts of battery storage systems with various energy-to-power ratios (EPRs) and at different levels of renewable penetration. We take ...
