What is a single phase inverter?

Single-phase inverters are ideal for smaller photovoltaic systems in the private or small commercial sector. They reliably convert the direct current generated into grid-compliant alternating current and are characterized by high efficiency, simple installation and low system costs.

Who should use a single-phase inverter?

Single-phase inverters are ideal for smaller solar systems, especially in private households. They are ideal for:
Private households: Single-family homes and small apartments with moderate power consumption. Small commercial enterprises: Offices, stores or workshops with manageable energy requirements.

What is the difference between a 1 phase and 3 phase inverter?

1-phase systems only supply the grid via a single phase, which can lead to imbalances during higher load peaks and greater consumption. In contrast, 3-phase inverters distribute the current more evenly across three phases, which improves grid stability and reduces the load on the individual lines.

What type of inverter is best for a small business?

Single-phase inverters are ideal for small systems with moderate power requirements, such as single-family homes or small commercial operations. They are inexpensive and easy to install. For larger or commercial systems with high energy requirements, 3-phase inverters are more suitable.
