Any electrical power grid must match electricity production to consumption, both of which vary significantly over time. Energy derived from solar and wind sources varies with the weather on time scales ranging from less than a second to weeks or longer. Nuclear power is less flexible than fossil fuels, meaning it cannot easily match the variations in demand. Thus, low-carbon electricity without storage presents special challenges to electric utilities.

Energy storage boosts electric grid reliability and lowers costs, <sup>47</sup> as storage technologies become more efficient and economically viable. One study found that the economic value of energy storage in the ...
