

Super Large Capacity South American Photovoltaic Folding Container for Cement Plants

I wrote the following code. When I try to run it as at the end of the file I get this stacktrace: AttributeError: "super" object has no attribute do_something class Parent: def __init__(self):...

A diretiva super, sem parânteses, permite ainda invocar métodos da classe que foi derivada através da seguinte syntax. super.metodo(); Isto é útil nos casos em que faças override ...

super() lets you avoid referring to the base class explicitly, which can be nice. But the main advantage comes with multiple inheritance, where all sorts of fun stuff can happen.

As for chaining super::super, as I mentionned in the question, I have still to find an interesting use to that. For now, I only see it as a hack, but it was worth mentioning, if only for the differences with Java ...

"super" object has no attribute "__sklearn_tags__". This occurs when I invoke the fit method on the RandomizedSearchCV object. I suspect it could be related to compatibility issues ...

In fact, multiple inheritance is the only case where super() is of any use. I would not recommend using it with classes using linear inheritance, where it's just useless overhead.

super() is a special use of the super keyword where you call a parameterless parent constructor. In general, the super keyword can be used to call overridden methods, access hidden ...

The implicit __class__ used by super does not exist at this point. Thus, referencing the superclass by the hardcoded name, as one had to do prior to super in Python2 will work - and is the ...
