

The photovoltaic line will not touch the inverter

Can a PV inverter be touched?

Touch the cables of the PV array on the insulation only. Do not touch any parts of the substructure or frame of the PV array. Do not connect PV strings with ground faults to the inverter. Ensure that no voltage is present and wait five minutes before touching any parts of the PV system or the product.

What does a ground fault on a PV inverter mean?

The inverter's display indicates a ground fault. A ground fault condition has been detected in the PV array. The PV array should be checked and any faults to ground repaired. A well-maintained and properly functioning PV system is crucial for ensuring sustainable and efficient energy production.

Why is my solar inverter NOT working?

Input Voltage Too High or Too Low AlarmSolar inverter failures can arise from various sources, but accurate troubleshooting significantly enhances emergency response efficiency. Regular inspection and preventive maintenance of the inverter are highly recommended to ensure the optimal and stable performance of your photovoltaic system.

What happens if a PV inverter shows the event number 3501?

If the inverter displays the event numbers 3501, 3601 or 3701, there could be a ground fault. The electrical insulation from the PV system to ground is defective or insufficient. If a ground fault occurs, parts of the system may still be live. Touching live parts and cables results in death or lethal injuries due to electric shock.

To solve this problem, it is first necessary to ensure that the inverter installation site is ventilated to prevent the inverter from being exposed to the sun. For the abnormal problem of the ...

Try to shorten the length of the AC output line of the inverter as much as possible, or use thicker copper core cables to reduce the voltage difference between the inverter and the grid.
