How is solar energy generated?

Solar energy - Electricity Generation: Solar radiation may be converted directly into solar power (electricity) by solar cells, or photovoltaic cells. In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.

How does solar power work?

How does this work? Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range from those found on rooftops of our homes and businesses to 'solar farms' stretching across acres of land.

What are the different types of solar power generation?

Solar power generation is categorized mainly into photovoltaic and photothermal power generation. Photovoltaic power generation involves the use of solar photovoltaic cells to convert sunlight directly into electric power based on the photovoltaic effect.
